Pl	EASE READ THE FOLLOWING INSTRU	CTIONS CAREFULLY

- After the examents, please/white rounstudent lb on every page. You will not be allowed to write anything once the examends.
- We will not grade anything outside of the space provided for a problem unless we are clearly told in the space provided for the westign of the elsewhere We will not glade scratch paper, all work must be on exam.
- The questions vary in difficulty. If you get stuck on any one, it helps to leave it and try another one.
- In general, no justification on short answer/true false questions is required unless otherwise indicated. Write your answers in boxes where provided.
- Calculators are not allowed. You do NOT need to simplify any probability related answers to a decimal fraction, but your answer must be in the simplest form (no summations or integrals).
- You may consult only 3 sheets of notes. Apart from that, you are not allowed to look at books, notes, etc. Any electronic devices such as phones and computers are NOT permitted.
- Regrades will be due quickly so watch piazza.
- There are 19 double sided pages on the exam. Notify a proctor immediately if a page is missing.
- You have **180** minutes: there are **6** sections with a total of **68** parts on this exam worth a total of **243** points.

Do not turn this page until your proctor tells you to do so.

14.	Consider continuous random variables, $X$ and $Y$ , with joint density that is $f(x,y) = 2$ for $x,y \in [0,1]$ and where $y < x$ . That is the list in the figure below.  A SSIGNATION OF THE PROPERTY OF THE PR
	Say someone takes a sample of $X$ or $X$ with equal probability, and then announces that the value is $2/3$ . What is the probability that the sample $X$ from $X$ $Y$
15.	Given a random variable $X \sim \operatorname{Expo}(\lambda)$ , consider the integer valued random variable $K = \lceil X \rceil$ .  (a) What is $Pr[K = k]$ ?
	(b) What standard distribution with associated parameter(s) does this correspond to?

#### 6. Longer Probability Questions.

#### 1. [I iterated my expectations, and you can, too!] (4 parts. 5 points each.)

Consider two discrete random variables X and Y. For notational purposes, X has probability mass function (or distribution),  $p_X(x) = Pr[X = x]$ , mean  $\mu_X$ , and variance  $\sigma_X^2$ . Similarly, random variable Y has PMF  $p_Y(y) = Pr[Y = y]$ , mean  $\mu_Y$  and variance  $\sigma_Y^2$ .

For each of True/False parts in this problem, either prove the corresponding statement is True in general or use exactly one of the counterexamples provided below to show the statement is False.

(a) Potential Counterexample I

(b) Potential Counterexample II

# (a) Suppose F[Y|X] County C

i. Show that  $c = \mu_Y$ , the mean of Y.

https://powcoder.com

#### Add WeChat powcoder

ii. True or False?

The random variables *X* and *Y* are independent.

iii. True or False?

The random variables X and Y are *uncorrelated*, meaning that cov(X,Y) = 0.

# https://powcoder.com Assignment Project Exam Help Assignment Project Exam Help

(b) Suppose X and Y are *uncorrelated*, meaning that cov(X,Y) = 0. True or Falset LDS. / DOWCOGET. COM

The conditional mean is E[Y|X] = c, where c is a fixed constant, meaning that E[Y|X] does *not* depend on X.

#### 2. [Estimations of a random variable with noise.] (6 parts. 2/4/2/2/4/8 points.)

Let random variable Y denote the blood pressure of a patient, and suppose we model it as a Gaussian random variable having mean  $\mu_Y$  and variance  $\sigma_V^2$ .

Our blood pressure monitor (measuring device) is faulty. It yields a measurement

$$X = Y + W$$

where the noise W is a zero mean Gaussian random variable ( $\mu_W = 0$ ) with variance  $\sigma_W^2$ . Assume that the noise W is *uncorrelated* with Y. Note, that the actual blood pressure Y is inaccessible to us, due to the additive noise W.

(a) Show that  $\sigma_X^2 = \sigma_Y^2 + \sigma_W^2$ .

### https://powcoder.com

# Assignment Project Exam Help

(b) Show that L(Y|X), the Linear Least-Square Error Estimate for the blood pressure Y, based on the

Assignment where  $a = \frac{\sigma_W^2}{\sigma_Y^2 + \sigma_W^2} \mu_Y$  and  $b = \frac{\sigma_Y^2}{\sigma_Y^2 + \sigma_W^2}$ 

https://powcoder.com

- (c) We now consider two extreme cases.
  - i. Suppose the blood pressure monitor has been repaired —that is, it introduces no noise. Determine a simple expression for L(Y|X) in this case.

ii. Suppose the blood pressure monitor's performance has deteriorated, so it now introduces noise whose variable  $\sigma_{ij}^2/\gg |\sigma_{ij}^2|$ . In the timit  $\sigma_{ij}^2/\gg |\sigma_{ij}^2|$ , what does your best linear estimator converge to? Explain briefly, in plain English words, why your answer makes sense.

## Assignment Project Exam Help

# Assignated type Gleat Exmontelp

(d) Recall L[Y] is a function of X and is a random variable. Let  $\hat{Y} = L[Y|X] = a + bX$ . Determine the distribution of Y and the appropriate parameters.

(e) We estimate  $\hat{\mu}_Y$  of the true mean  $\mu_Y$  as

$$\widehat{\mu}_Y = \frac{X_1 + \dots + X_n}{n},$$

where  $X_i$  are independent measurements of the random variable X = Y + W.

We want to be at least 95% confident that the absolute error  $|\hat{\mu}_Y - \mu_Y|$  is within 4% of  $\mu_Y$ . Your task is to determine the *minimum* number of measurements n needed so that

$$Pr[|\widehat{\mu}_Y - \mu_Y| \le 0.04 \,\mu_Y] \ge 0.95.$$

You may assume that  $\sigma_Y^2 = 12$  and  $\sigma_W^2 = 4$  and that the true mean  $\mu_Y \in [60, 90]$ .

(Remember that in this course, you may assume that a Gaussian random variable lies within  $2\sigma$ of its mean with 95% probability.) https://powcoder.com

3. [Derive the Unexpected from a Uniform PDF] (2 parts. 3/2 points.)

You wish to use  $X \sim U[0,1)$  to produce a different *nonnegative* random variable  $Y = -\frac{1}{\lambda} \ln(1-X)$ , for  $0 \le X < 1$ , where  $\lambda$  is a positive constant, and  $\ln$  is the natural logarithm function. (Note that the pdf for  $X \sim U[0,1)$  is the same as for  $X \sim U[0,1]$ .)

(a) Determine the CDF  $F_Y(y) = Pr[Y \le y]$ . [It may be useful to recall that  $F_x(x) = x$  for  $x \in [0, 1)$ .]

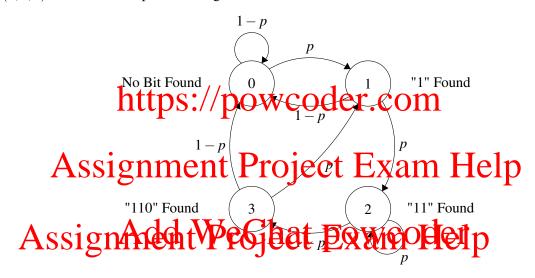

# https://powcoder.com Assignment Project Exam Help Assignment Project Exam Help Assignment Project Exam Help https://powcoder.com

(b) Determine the PDF  $f_Y(y)$  and indicate what standard distribution it corresponds to. Add WeChat powcoder

#### 4. [Finding a Three-Bit String in a Binary Bitsream] (3 parts. 2/5/5 points.)

Consider a bitstream  $B_1, B_2, ...$  consisting of IID Bernoulli random variables obeying the probabilities  $Pr[B_n = 1] = p$ , and  $Pr[B_n = 0] = 1 - p$ , for every n = 1, 2, ...Here, 0 .

We begin parsing the bitstream from the beginning, in search of a desired binary string represented by the codeword c = (1,1,0). We say that we've encountered the codeword c at time n if  $(B_{n-2},B_{n-1},B_n) = (1,1,0)$ . We model this process using the Markov chain shown below.

There are four states, labeled 0.1,2, and 3. The state number i represents the number of the leading (leftmost) bits of the power i power i to the leading (leftmost) bit. For example, being in state 2, means you saw a 11 in the two latest bits.

That is, if  $X_n$  denote the state of the process at time n and and the bit-stream consists of  $B_1, \ldots, B_n$ . We have  $X_n = 2$  when  $A_n = 0$ . We begin with  $X_n = 0$  by default which corresponds to no prefix of the codeword C = 110 has been read.

(a) Provide a clear, succinct explanation as to why the Markov chain above has a set of unique limiting-state (i.e., stationary) probabilities:

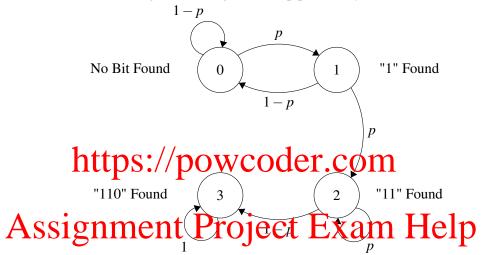

$$\pi_i = \lim_{n \to \infty} Pr[X_n = i], \qquad i = 0, 1, 2, 3.$$

(b) Determine a simple expression for the limiting-state probability  $\pi_3$  of State 3. To receive full credit, you must explain your answer. Depending on how you tackle this part, you may need only a small fraction of the space given to you below.

Assignment Project Exam Help
Assignment Project Exam Help
Assignment Project Exam Help

Add WeChat powcoder

(c) For the remainder of this problem, we want to find the *expected time* E(N) until the first occurrence of the string c=110 in the bitstream.

Accordingly, we remove all the outgoing edges from State 3 in the original Markov chain, and turn State 3 into an absorbing state having a self-loop probability of 1 as below.

Determine E(N), the expected time at which we first enter State 3—that is, the time at which the

Atring c = (1, 1, 0) occurs for the first filling at in Executing Form (1, 1, 0) occurs for the first filling (1, 1, 0) occurs for the filling (1, 1, 0

determine  $E(N_{23})$ , and put your results together to obtain E(N).
